3.2	PLUGIN_SPELLCHECKER_SELECTED_LANGUAGES	5
4	Usage	6
4.1	Enable the spellchecker plugin in settings	6
4.2	Use the spellchecker plugin	7
4.3	Switch language	7

Edition 1.0 - The Kopano Team

This document, the Spellchecker Manual, describes how to install, configure and use the Kopano WebApp Spellchecker plugin.

CHAPTER 1

Introduction

This manual describes how to install, maintain and use the Kopano WebApp spellchecker plugin.

CHAPTER 2

Installation

The spellchecker plugin requires just a few simple installation steps to get it up and running. Follow the steps below to set-up the spellchecker plugin for all the users on your WebApp server.

More information about WebApp plugin support can be found here: 'http://documentation.kopano.io/support_lifecycle_policy/webapp_support_lifecycle.html'

2.1 RPM based distributions

Use the following command to install the Kopano spellchecker package on RPM based distributions:

```
rpm -Uhv kopano-webapp-plugins-filepreviewer_version_.noarch.rpm
```

Replace <version> with the correct version.

2.2 DEB based distributions

On Debian based distributions use:

```
dpkg -i kopano-webapp-plugins-filepreviewer_version_all.deb
```

Replace <version> with the correct version.

2.3 Dependencies

Php-enchant is needed to use the spellchecker.

Note: Make sure the enchant module is enabled on your server

Warning: Php-enchant is not available in the official SUSE SLE-11 repository. Unofficial / unsupported packages can be found on the OpenSUSE website.

In the next chapter we will go into details on how to configure the spellchecker plugin.

2.4 Additional language packs

Language packs can be installed the same way as the spellchecker plugin. These language packs should be installed before you can use the spellchecker.

If you do not have language packs installed you will see the following message in the WebApp mail settings:

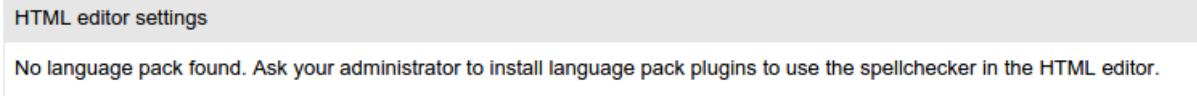

Fig. 2.1: No language packs installed

CHAPTER 3

Configuration

To configure the spellchecker plugin, please edit the following file:

```
/etc/kopano/webapp/config-spell.php
```

This file contains multiple configuration options.

3.1 PLUGIN_SPELLCHECKER_USER_DEFAULT_ENABLE

This option allows you to enable or disable the plugin by default for a user.

3.2 PLUGIN_SPELLCHECKER_SELECTED_LANGUAGES

This option allows you to enable languages by default for a user. These languages should be installed on your server.

CHAPTER 4

Usage

4.1 Enable the spellchecker plugin in settings

Spellchecker languagepacks should be enabled via your settings. These settings can be found in “Settings -> Mail -> HTML editor settings”.

Note: Please be aware that for the spellchecker button to be visible by default, your admin has to define a default language in config-spell.php. Alternatively, a user can enable the spellchecker and languages via the settings menu.

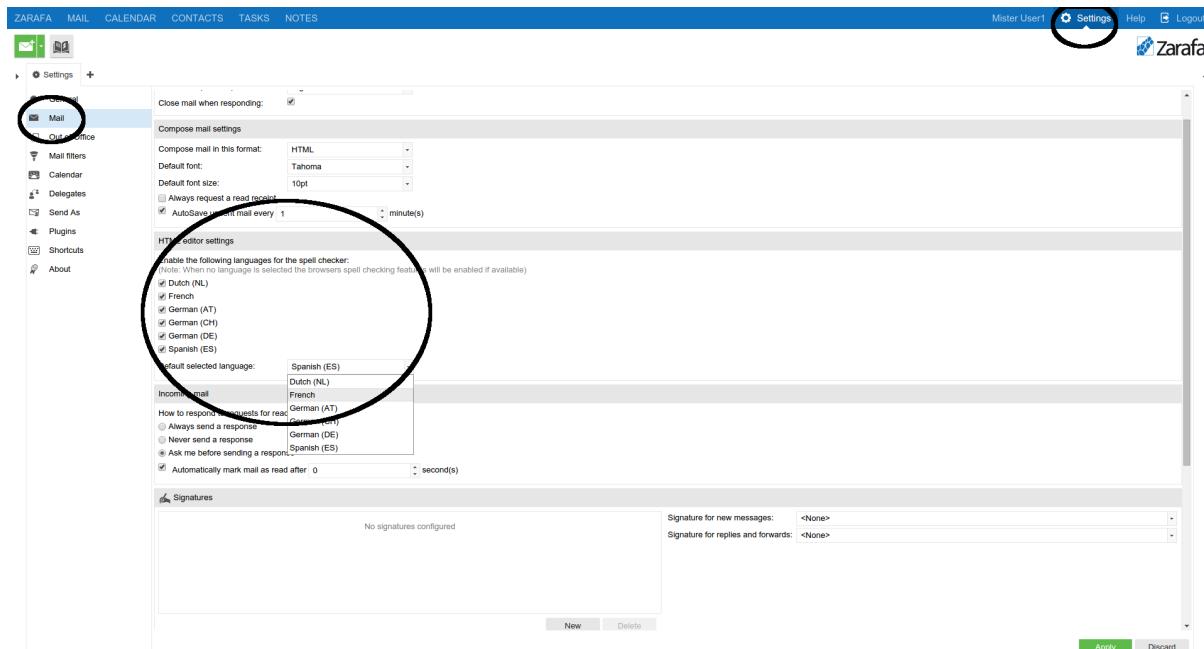

Fig. 4.1: Spellchecker in settings

4.2 Use the spellchecker plugin

After you've typed a word you can check the spelling by clicking the spellcheck button in the editor. If a word is invalid, you can see spelling suggestion by left-clicking the word.

4.3 Switch language

Switching between enabled languages can be done easily. Simply click the dropdown next to the spellcheck button and a dropdown with languages will appear.
